

UI Screen Analysis & Business Improvement Report – 2026-08-18

Portfolio Manager v2. Analysis of all 8 current screens from technology and business perspectives, compared against leading Canadian retail trading platforms (Wealthsimple Trade, Questrade, TD Direct Investing, Wealthica) and international platforms (Interactive Brokers, Robinhood, IBKR).

Executive Summary

The application has a solid technical foundation – Angular 22 signals architecture, real-time live prices, role-based access, and a sophisticated RSI signal engine. The primary business gaps are: (1) no portfolio performance analytics, (2) no tax/ACB reporting, (3) no dashboard/home screen, and (4) missing action-oriented features that support trade decision-making (position sizing, alerts, earnings calendar). Technology gaps centre on missing virtual scrolling for large portfolios, no push notifications, and no benchmark comparison.

Screen 1 – Portfolio (`/portfolio`) Analysed

****Purpose**:** Central hub for tracking all open and closed positions (stocks, cash, options, manual entries).

Strengths

- Card + Grid toggle appropriate for different use cases
- Column configuration lets power users customise the view
- 30-second auto-refresh of live prices
- Backup / Restore to JSON for data protection
- Export to CSV for external analysis
- Demo mode for safe screenshot sharing

Technology Gaps

- No skeleton loading state in grid view (blank rows appear during load)
- Grid renders all rows at once – will be slow with 100+ positions (no virtual scrolling)
- Column configuration state stored in localStorage – lost if browser data is cleared
- No "Add to Watchlist" quick action directly from the grid

Business Gaps

- ****No performance metrics visible**** – no annualized return, no Sharpe ratio, no maximum drawdown
- ****No account type grouping**** – positions are grouped by symbol, not by account (TFSA vs. RRSP vs. Margin). Canadian investors manage these accounts separately for tax purposes.
- ****No realized P&L summary**** – closed positions exist in the database but there is no KPI card showing total realized gain/loss
- ****No benchmark comparison**** – no way to compare portfolio return to TSX Composite or S&P 500
- ****No position risk indicator**** – no visual flag when a position exceeds the allocation limit configured in Config
- ****No dividend income column**** – high-yield TSX stocks (banks 4-5%, pipelines 6-8%, REITs 5-8%) produce significant income that is not tracked
- ****No cost basis edit audit**** – no history of when average cost was changed

Recommended Improvements

1. Add a "Performance Summary" panel above the grid: total return, annualized return, max drawdown, Sharpe ratio.
2. Add account type sub-tabs or filter pill (TFSA / RRSP / Margin / Corp).
3. Add a realized P&L KPI card (sum of all closed position gains/losses).
4. Show a "Limit Alert" badge when a position exceeds its holding role size limit.

Screen 2 – Transactions (`/transactions`) Analysed

****Purpose****: Audit trail of all position opens, closes, and options transactions.

Strengths

- Open/Close filter toggle with clean separation
- Decision Source tracking (App Signal, Manual, Catalyst, etc.)
- Collapsible Stocks/Options sections
- Notes dialog per transaction
- Export stocks to CSV

Technology Gaps

- OPEN records are filtered with a hardcoded date threshold (`2026-06-01`) – no UI control to adjust this
- Options transactions cannot be exported (stocks-only export)
- No bulk edit or bulk notes update
- No sort by date (rows display in fixed database order)

Business Gaps

- ****No P&L by account type**** – critical for separating TFSA (tax-free) vs. non-registered (taxable) gains
- ****No performance by Decision Source**** – "Was App Signal more profitable than Manual?" – this metric directly validates the scanner's value
- ****No tax year filter**** – for capital gains reporting, users need all closes within a calendar year (January 1 – December 31)
- ****No ACB column**** – the legally required Adjusted Cost Base per lot is not tracked
- ****No trade timeline visualization**** – no chart of position opens/closes over time
- ****No P&L attribution**** – which sectors or decision sources generated the most profit?

Recommended Improvements

1. Add Decision Source performance analytics: win rate and average return per source.
2. Add a tax year date filter for realized gains/losses reporting.
3. Enable options transaction export.
4. Add a realized P&L column to closed transactions.

Screen 3 – RSI Scanner (`/scanner`) Analysed

****Purpose****: Real-time RSI-based signal detection across 50 TSX stocks plus the user's portfolio and watchlist symbols.

Strengths

- 5-indicator confirmation system (RSI, Stochastic, MACD, Bollinger, Volume)
- EOD window banner and morning briefing panel
- Portfolio/Watchlist badges highlighting held symbols
- Legacy/Enhanced logic mode toggle
- Ad-hoc analyzer for manual symbol research
- Auto-refresh every 5 minutes (configurable)

Technology Gaps

- Timezone hardcoded to Eastern Time – users in other timezones see incorrect time context for the EOD window
- No push or browser notifications when signals appear (user must have the tab open)
- No sort controls on the scan results table (cannot sort by RSI value, volume ratio, or reversal probability)
- Column configuration is global – cannot have different columns for Oversold vs. Overbought views
- Ad-hoc session results stored to DB but not user-attributed

Business Gaps

- ****No signal performance history**** – "Of the 15 Confirmed signals in the last 30 days, how many followed through?" This context would build confidence in the algorithm.
- ****No price alert capability**** – users cannot set "notify me when RY.TO RSI drops below 35"
- ****No sector-level summary**** – "3 Energy stocks oversold today, 0 Financials" – critical context for sector rotation decisions
- ****No quick-add to Watchlist**** – a scanned symbol cannot be added to the watchlist in one click from the scan results
- ****Signal terminology is opaque**** – EodConfirm, EarlyWarning, TrendShift, TurnStrength, ChaseRisk are not explained anywhere in the UI. New users have no context.

Recommended Improvements

1. Add a "Signal Performance" KPI above the table: last 30 days Confirmed signal win rate.
2. Add a "Add to Watchlist" button per result row.
3. Add a sector summary bar ("Oversold today: 2 Energy, 1 Financials, 1 Materials").
4. Add a "Signal Legend" collapsible panel or tooltips explaining each status.
5. Add browser notification support (Web Notifications API) for EOD Confirm signals.

Screen 4 – Allocation (`/allocation`) Analysed

****Purpose****: Portfolio composition analysis – sector breakdown, beta risk contribution, cash and options summary.

Strengths

- Combined total value across all asset types (stocks + cash + options)
- Sector exposure with industry drill-down
- Weighted portfolio beta with per-symbol contribution
- Manual beta overrides per symbol

Technology Gaps

- Beta overrides are not persisted to the backend – lost on page reload
- No loading skeleton for the beta calculation section
- Sector chart has no colour coding by risk level or divergence from target
- No allocation export to CSV or PDF

Business Gaps

- ****No target vs. actual allocation**** – the Config screen allows sector targets and position limits, but the Allocation screen does not show how far over or under each target the portfolio is
- ****No rebalancing suggestions**** – "You are 8% overweight Financials relative to your 20% target. Consider reducing."

- ****No geographic allocation**** – Canada vs. US vs. International exposure (relevant for CDR holders)
- ****No market-cap breakdown**** – Large cap / Mid cap / Small cap
- ****No holding role allocation vs. targets**** – Core / Strategic / Swing / Speculative actual vs. configured targets
- ****No correlation data**** – two large positions that are 0.95 correlated provide effectively zero diversification benefit; this is invisible
- ****Portfolio beta context missing**** – a beta of 1.2 vs. TSX means 20% more volatile than the market, but no benchmark context is displayed

Recommended Improvements

1. Add "Target vs. Actual" horizontal bars for each sector (showing % over/under target in red/green).
2. Show holding role allocation (Core/Strategic/Swing) vs. configured targets.
3. Persist beta overrides to the backend.
4. Add a geographic exposure tile (Canada / USA / International).

Screen 5 – Watchlist (`/watchlist`) Analysed

****Purpose****: Curated research list of symbols under active monitoring, with integrated technical and value scoring.

Strengths

- Card + Grid toggle with rich technical data per symbol
- Favourite flagging for quick access
- Role assignment (Core/Strategic/Swing/Speculative/Options)
- Integration with RSI scanner and Value Screener data
- Backup / Restore / Export to Excel

Technology Gaps

- Value Screener data is loaded from the last DB snapshot – may be weeks old with no visible freshness indicator
- No per-symbol RSI refresh (must trigger the full scanner)
- No comparison mode (view two watchlist symbols side by side)
- No skeleton loading in card view during initial data fetch

Business Gaps

- ****No earnings date**** – knowing when a watchlist symbol reports earnings is critical for swing traders (entry/exit timing around catalysts)
- ****No price alerts**** – cannot set a target entry price with a notification
- ****No sector grouping**** – symbols listed flat; no visual grouping by sector for portfolio construction context
- ****No conviction scoring**** – the "Role" field provides categorisation but no relative conviction level (e.g., 1-5 stars)

- ****Value Screener data freshness**** – a score from 3 weeks ago may be misleading; users have no awareness of staleness unless they check the screener page

Recommended Improvements

1. Show "Value Score last updated: X days ago" on each watchlist card.
2. Add sector grouping option in the grid view.
3. Add an earnings date column (available from Yahoo Finance ``v10/quoteSummary``).
4. Add a per-symbol "Refresh Value Score" button.

Screen 6 – EOD Signals (``/eod-signals``) Analysed

****Purpose****: Historical record of all confirmed signals with lifecycle state tracking (Active → FollowThrough / Invalidated / Expired / Reversed).

Strengths

- Paginated table with comprehensive filters (ticker, scan type, signal type, state, rule version, date range)
- Signal lifecycle state tracking with notes
- Auto-polling for new signals with snackbar notification
- Current price enrichment (live price vs. entry price, % difference)
- Export to Excel
- Per-signal notes

Technology Gaps

- Auto-refresh polls every 30 seconds even when no signals are expected (e.g., weekends, outside market hours)
- "Delete All" deletes all records with only a confirmation dialog – no scope limitation, no soft delete, no undo
- Sorting is client-side on the current page only (accurate for 50 rows, misleading when comparing across pages)

Business Gaps

- ****No performance analytics**** – What percentage of FollowThrough signals were profitable? What was the average return and average holding period? This is the most important metric for validating the entire signal engine.
- ****No visual signal timeline**** – a chart of signal count per week over the last 90 days would reveal whether the algorithm is generating more or fewer signals over time
- ****No sector concentration**** – which sectors appear most often in the signal history?
- ****No signal aging alerts**** – a signal that has been "Active" for 30+ days with no state update may be forgotten
- ****No bulk state update**** – cannot select 10 old Active signals and change them to Expired at once

- ****No rule version comparison**** – "Enhanced vs. Legacy: which generated more profitable signals per quarter?"

Recommended Improvements

1. Add a performance summary panel: win rate, average return, average holding period on FollowThrough signals.
2. Add bulk state update (multi-select checkbox + change state dropdown).
3. Add an "Age" column: days since signal date. Visually highlight signals Active > 20 days.
4. Add a signal count chart over the last 90 days (bar chart by week).

Screen 7 – Value Screener (`/value-screener`) Analysed

****Purpose****: Multi-factor value investing analysis: earnings yield, FCF yield, Price-to-Book, Piotroski F-Score, ROIC.

Strengths

- Three source modes (Portfolio, Watchlist, Ad-hoc symbols)
- Tier classification (High Conviction / Fair Value / Value Trap)
- Last run timestamp displayed
- Technical state integration with RSI scanner
- Export to CSV

Technology Gaps

- No per-symbol progress indicator during refresh (only a spinner – no "analyzing RY.TO 12/25")
- Ad-hoc results are not persisted – lost on navigation away
- Scheduled background refresh runs at a fixed time; no manual trigger from this screen

Business Gaps

- ****No factor breakdown visible**** – for each result, which of the 5 factors scored well? Currently only a total score is shown. Users cannot understand why a stock scored 8.5 vs. 4.0.
- ****No historical score comparison**** – was TD Bank higher value 3 months ago? No score history is tracked.
- ****No dividend yield in scoring**** – for Canadian income investors, dividend yield is often the primary valuation metric. Banks, pipelines, and REITs are the most common TSX holdings and all have significant yields.
- ****No minimum score filter**** – users cannot filter to "only show symbols with score > 7.0"
- ****No sector-adjusted scoring context**** – a P/B of 1.5 is "undervalued" for a tech stock but "normal" for a bank. The engine routes REITs and financials correctly, but the user sees no explanation.

Recommended Improvements

1. Show per-factor scores inline (5 mini-indicator bars or icons per row: F1-F5).
2. Persist ad-hoc results linked to user session.
3. Add a minimum score filter slider (e.g., "Show only scores ≥ 7.0 ").
4. Add dividend yield as an optional scoring factor with configurable weight.
5. Track and display score history (last 3 runs) per symbol.

Screen 8 – Configuration (`/config`)  Analysed

****Purpose****: Global application settings, user management, notification configuration, scanner parameters.

Strengths

- Comprehensive tab organisation covering all configurable areas
- Role-based access control (some tabs admin-only)
- Inline form validation with clear error states
- Snackbar feedback on save and error

Technology Gaps

- "Save All" saves all tabs simultaneously – a validation error in one tab blocks saving another
- No per-section Save button
- No settings backup/restore to JSON (ironic given portfolio data has this feature)
- No audit trail – no log of who changed what setting and when

Business Gaps

- ****User management lacks last-login visibility**** – admins cannot see when each user last accessed the system
- ****No email preview**** – the notification system sends formatted HTML emails, but admins cannot preview the template from the Config screen
- ****No notification test send**** – must wait for a real signal to test email delivery
- ****No inline help text**** – the Config screen has no tooltips or explanatory text for settings like `TrendShiftThreshold` or `EodWindowStart`

Recommended Improvements

1. Add per-section Save buttons alongside the global Save All.
2. Add a "Send Test Email" button on the Alerts tab.
3. Add settings change audit log (user, timestamp, old value, new value).
4. Add inline help text / ? icon tooltips for each setting.

Missing Screens – High Business Value

Missing Screen A – Dashboard / Home Analysed

****Business need****: Every professional investing platform has a dashboard page. Currently the app opens directly to Portfolio with no daily overview context.

****Recommended content****:

- Today's portfolio value change (\$ and %) vs. yesterday's close
- Active RSI signal count: X oversold, Y overbought
- Market indices bar (already exists in Scanner – promote to dashboard)
- Upcoming earnings for portfolio + watchlist symbols (next 7 days)
- Quick action tiles: Scan Now, Analyze Watchlist, Add Transaction

****Competitive gap****: Wealthsimple Trade, TD Direct Investing, and Questrade all lead with a dashboard page.

Missing Screen B – Performance Analytics Analysed

****Business need****: Historical portfolio performance vs. a benchmark, with risk-adjusted metrics.

****Recommended content****:

- Portfolio value chart with date range selector (1M / 3M / 6M / 1Y / All)
- TWRR and annualized return vs. TSX Composite benchmark overlay
- Rolling Sharpe ratio
- Maximum drawdown visualization
- Best/worst months table
- Return attribution by sector and holding role

****Data source****: The `PortfolioValueHistories` table already captures daily total values. The benchmark line requires fetching TSX Composite (`^GSPTSE`) historical data from Yahoo Finance (same endpoint already used for stocks).

****Competitive gap****: Wealthica (Canadian) and Sharesight provide exactly this. Both are popular with TSX-focused retail investors precisely because brokers' performance reports are inadequate.

Missing Screen C – Tax Report / ACB Calculator Analysed

****Business need****: Canadian investors must calculate capital gains and losses for their annual tax return using the Adjusted Cost Base (ACB) method.

****Recommended content****:

- Realized gains/losses by calendar year
- ACB per symbol with full lot purchase history
- TFSA / RRSP / Non-Registered account segregation (gains are only taxable in non-registered accounts)
- T5008 / Schedule 3 format summary export

****Competitive gap****: Every Canadian broker provides this in their year-end tax packages. Third-party tools Wealthica and AdjustedCostBase.ca are widely used by DIY investors because broker reports are often incomplete or formatted incorrectly.

Missing Screen D – Earnings Calendar Analysed

****Business need****: Knowing when portfolio and watchlist companies report earnings is critical for risk management – avoid holding through earnings on a large position, or time a swing entry before an expected positive catalyst.

****Data source****: Yahoo Finance `v10/quoteSummary` returns `earningsDate` (next scheduled earnings) for each symbol.

****Recommended content****:

- Calendar or list view: next 30 days of earnings dates
- Colour-coded by source: portfolio holding vs. watchlist vs. market scan symbol
- Expected move estimate (based on ATR as a proxy for historical volatility)
- Link to Value Screener score for each upcoming reporter

Missing Screen E – Price Alerts & Notifications Analysed

****Business need****: Users should not need to check the scanner manually. A price drop below a configured RSI threshold or price target should trigger a notification automatically.

****Recommended content****:

- Alert setup: symbol, condition (RSI below X, price below Y, price above Z)
- Notification method: in-app, email (SMTP already configured)
- Alert history log: when each alert was triggered
- Active vs. resolved alert management

****Technical path****: The background scanner service already runs every 5 minutes and evaluates RSI conditions. Extending it to check user-defined alert conditions is incremental work on an existing pipeline.

Overall Priority & Decision Matrix

Improvement Tech Effort	Status	Screen	Business Value
-----	-----	-----	-----
Performance Analytics screen	Medium	New (B)	Very High
Dashboard / Home screen	Medium	New (A)	High
Target vs. Actual allocation bars	Low	Allocation	High
Signal performance analytics panel	Medium	EOD Signals	High
Account type grouping in Portfolio	Medium	Portfolio	High
Decision Source win rate analytics	Low	Transactions	High
Per-factor scores in Value Screener	Low	Value Screener	Medium
Earnings calendar screen	Medium	New (D)	High
Sector summary bar in Scanner	Low	Scanner	Medium
Quick-add to Watchlist from Scanner	Low	Scanner	Medium
Persist beta overrides to backend	Low	Allocation	Medium
Signal legend / onboarding tooltips	Low	Scanner	Medium
Tax Report / ACB screen	High	New (C)	Very High
Price Alerts & Notifications screen	High	New (E)	High
Send Test Email button in Config	Low	Config	Low
Settings audit log	Medium	Config	Low
